Table 1: Gravitational wave data summary for models discussed in Burrows et al., ApJ 665, 416 (2007). Δt is the amount of postbounce time covered in each model, $h_{+,\mathrm{max}}$ is the maximum axisymmetric gravitational wave strain amplitude scaled to 10 kpc distance, $h_{\mathrm{char,max}}$ is the maximum of the characteristic strain spectrum (Flanagan & Hughes, PRD 57, 4535 (1998)) and f_{peak} is the frequency at which $h_{\mathrm{char,max}}$ is located. E_{GW} is the total energy radiated in gravitational waves.

Model	Δt	$\|h_{+,\mathrm{max}}\|$ at 10 kpc	$h_{\mathrm{char,max}}$ at 10 kpc	f_{peak}	E_{GW}
	(ms)	(10^{-21})	(10^{-21})	(Hz)	$(10^{-7}\ \mathrm{M}_\odot\ c^2)$
