

Surveys at $z \sim 1$

Petchara Pattarakijwanich
20 February 2013

Outline

- ▶ Context & Motivation.
- ▶ Basics of Galaxy Survey.
 - ▶ SDSS
 - ▶ COMBO-17
 - ▶ DEEP2
 - ▶ COSMOS
- ▶ Scientific Results and Implications.
 - ▶ Properties of $z \sim 1$ galaxies.
 - ▶ Evolution of blue galaxies.
 - ▶ Evolution of red galaxies.
- ▶ Future Surveys.
 - ▶ HSC
 - ▶ PFS
 - ▶ LSST

Motivation

- ▶ Munan and Alex talked about local galaxies last week.
- ▶ How about the evolution as a function of cosmic time?

Blanton & Moustakas 2009

How do we study evolution?

- ▶ Matching high- z progenitors to local products is non-trivial.
- ▶ Need flow diagram in various parameters to constrain models.
- ▶ **To do this, need galaxy redshift surveys.**

Galaxy Survey 101

- ▶ Photometric Dataset.
 - ▶ Brightness
 - ▶ Colors
 - ▶ Morphology
 - ▶ Photometric Redshift
 - ▶ Crude Stellar Population
- ▶ Target Selection.
 - ▶ Color
 - ▶ Morphology
- ▶ Spectroscopic Follow-up.
 - ▶ Spectroscopic Redshift
 - ▶ Emission & Absorption lines
 - ▶ Dynamics
 - ▶ Metallicity
 - ▶ Stellar Population & AGN
 - ▶ etc.

Sloan Digital Sky Survey (SDSS)

- ▶ Perfect example for redshift survey, but very non-ideal for $z \sim 1$ work.
- ▶ SDSS main galaxy sample is very uniform and ideal for studying galaxies but is too local ($z \sim 0.2$).
- ▶ BOSS galaxy sample (CMASS) are extremely biased (because it was targeted for BAO science).

COMBO-17 & DEEP2

▶ COMBO-17

- ▶ Image 1 deg^2 with 17 broad & medium band filters.
- ▶ To $R_{\text{Vega}} \sim 26$
- ▶ $\sim 30,000$ galaxies with good photometric redshift.

▶ DEEP2

- ▶ ~ 100 nights survey with Keck DEIMOS.
- ▶ 2.8 deg^2 area down to $R_{\text{AB}} = 24.1$.
- ▶ Target $\sim 50,000$ galaxies at $z > 0.7$ with $\sim 40,000$ successful redshift.

COSMOS

- ▶ HST survey over 2 deg^2 .
- ▶ Largest HST survey ever taken by area.
- ▶ Augmented by data from various observatories from X-ray to Radio.
- ▶ Extreme multi-band dataset with HST optical resolution.

| Data | Bands/ λ /Res. | Number of Objects | Sensitivity ^a | Investigators | Time |
|-----------------------------|----------------------------|-------------------|---|------------------------|------------|
| <i>HST</i> ACS..... | 814I | | 28.8 | Scoville et al. | 581 orbits |
| | 475g | | 28.15 | Scoville et al. | 9 orbits |
| <i>HST</i> NIC3..... | 160W | | 25.6 (6% area) | Scoville et al. | 590 orbits |
| <i>HST</i> WFC2..... | 300W | | 25.4 | Scoville et al. | 590 orbits |
| Subaru SCam..... | <i>B, V, r', i, z', g'</i> | | 28–26 | Taniguchi et al. | 10 n |
| | 10 IB filters | | 26 | Taniguchi, Scoville | 11 n |
| | NB816 | | 25 | Taniguchi et al. | 8 n |
| CFHT Megacam..... | <i>u*</i> | | 27 | Sanders et al. | 24 hr |
| | <i>u, i*</i> | | 26 | LeFevre et al. | 12 hr |
| CFHT LS..... | <i>u-z</i> | | | Deep LS Survey | |
| NOAO CTIO..... | <i>K_s</i> | | 21 | Mobasher et al. | 18 n |
| CFHT UKIRT..... | <i>J, H, K</i> | | 24.5–23.5 | Sanders et al. | 12 n |
| UH-88..... | <i>J</i> | | 21 | Sanders et al. | 10 n |
| <i>GALEX</i> | FUV, NUV | | 26.1, 25.8 | Schminovich et al. | 200 ks |
| <i>XMM-Newton</i> EPIC..... | 0.5–10 keV | | 10 ⁻¹⁵ cgs | Hasinger et al. | 1.4 Ms |
| <i>Chandra</i> | 0.5–7 keV | | | Elvis et al. | Future |
| VLT VIMOS sp..... | <i>R = 200</i> | 3000 | <i>I < 23</i> | Kneib et al. | 20 hr |
| | <i>R = 600</i> | 20000 | <i>I < 22.5, 0.1 ≤ z ≤ 1.2</i> | Lilly et al. | 600 hr |
| | <i>R = 200</i> | 10000 | <i>B < 25, 1.4 ≤ z ≤ 3.0</i> | Lilly et al. | 600 hr |
| Mag. IMAX sp..... | <i>R = 3000</i> | 2000 | | Impey, McCarthy, Elvis | 12 n |
| Keck GEMINI sp..... | <i>R = 5000</i> | 4000 | <i>I < 24</i> | Team Members | |
| <i>Spitzer</i> MIPS..... | 160, 70, 24 μ m | | 17, 1, 0.15 mJy | Sanders et al. | 392 hr |
| <i>Spitzer</i> IRAC..... | 8, 6, 4.5, 3 μ m | | 11, 9, 3, 2 μ Jy | Sanders et al. | 220 hr |
| IRAM MAMBO..... | 1.2 mm | | 1 mJy (20 × 20') | Bertoldi et al. | 90 hr |
| CSO Bolocam..... | 1.1 mm | | 3 mJy | Aquirre et al. | 40 n |
| JCMT Aztec..... | 1.1 mm | | 0.9 mJy (1 σ) | Sanders et al. | 5 n |
| VLA A..... | 20 cm | | 7 μ Jy (1 σ) | Schinnerer et al. | 60 hr |
| VLA A/C..... | 20 cm | | 10 μ Jy (1 σ) | Schinnerer et al. | 275 hr |
| SZA (full field)..... | 9 mm | | S–Z to 2 × 10 ¹⁴ M_{\odot} | Carlstrom et al. | 2 mth |

Properties of $z \sim 1$ galaxies

- ▶ Clearly two distinct population already in place at $z \sim 1$.

Cooper et al (2006)

Properties of $z \sim 1$ galaxies

- ▶ Red galaxies are bulgy ($n \sim 4$), non star-forming and have large σ (pressure supported).
- ▶ Blue galaxies are diskly ($n \sim 1$), star-forming and have small σ (rotation supported).
- ▶ **All the correlation we see in local galaxy population also holds at $z \sim 1$.**
- ▶ Whatever process made these correlations, took place before $z \sim 1$.

Bell et al (2012)

Evolution of Blue Galaxies

- ▶ Star formation rate in blue galaxies decrease with cosmic time in a narrow sequence.
- ▶ **The Main Sequence of Star-Forming Galaxies.**
- ▶ Narrow sequence supports steady star-formation that gradually declines, rather than bursty star-formation.

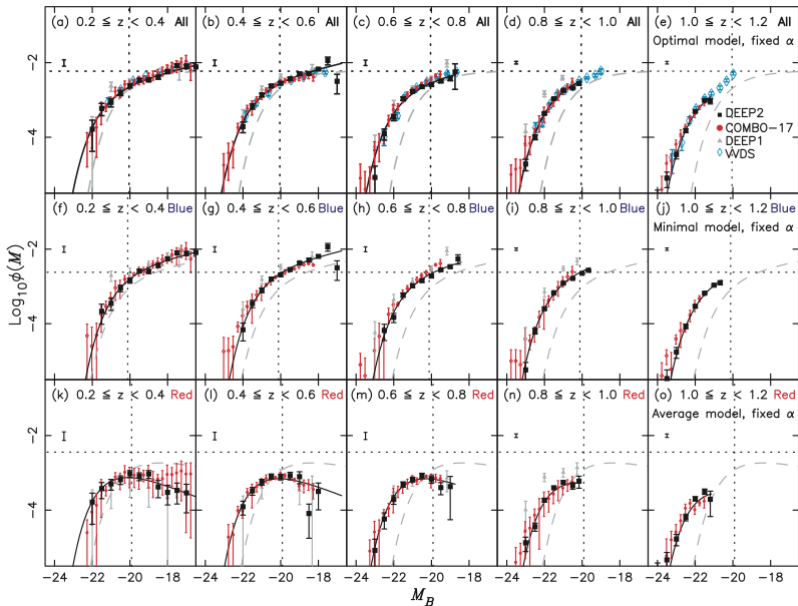

Noeske et al (2007)

Schechter Function

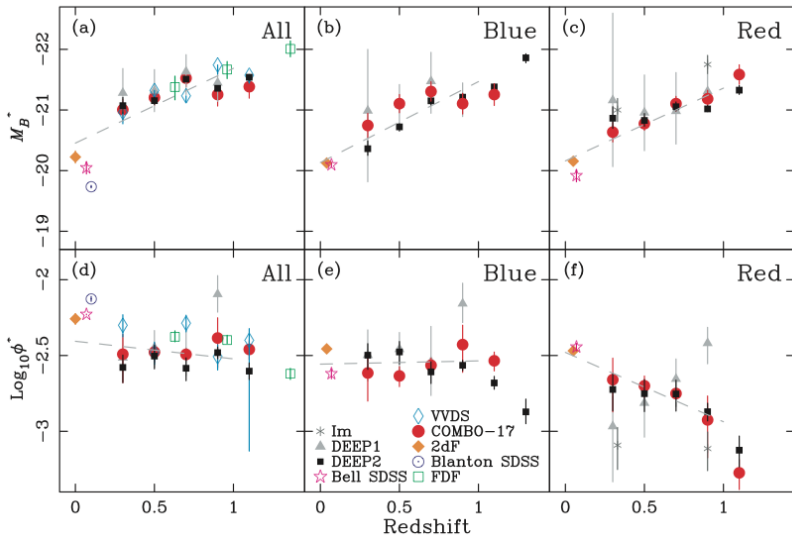

- ▶ Functional form commonly used to fit luminosity function
- ▶ $\Phi(L) = \frac{\phi^*}{L^*} \left(\frac{L}{L^*}\right)^\alpha \exp\left(-\frac{L}{L^*}\right)$
- ▶ $\Phi(M) = \frac{\ln 10}{2.5} \phi^* 10^{0.4(\alpha+1)(M-M^*)} \exp(-10^{0.4(M-M^*)})$
- ▶ $L_{\text{total}} = \int_0^\infty L \phi(L) dL = \phi^* L^* \Gamma(\alpha + 2)$

Evolution of Red Galaxies

Evolution of Red Galaxies

Faber et al (2007)

Evolution of Red Galaxies

- ▶ Number of red galaxies increased by ~ 2 between $z \sim 1 \rightarrow 0$.
- ▶ This increase must be due to blue galaxies at $z \sim 1$ turn red.
- ▶ Various possible scenarios:
 - ▶ Early quenching + Dry mergers (Left)
 - ▶ Late quenching + No dry mergers (Middle)
 - ▶ “Mixed” scenario (Right)
- ▶ Constrain using known properties of local ellipticals.

Faber et al (2007)

Evolution of Red Galaxies

- ▶ Early quenching + Dry mergers
 - ▶ Predict vast amount of small red galaxies (not observed).
 - ▶ Large amount of dry mergers destroys age-metallicity relation.
- ▶ Late quenching + No dry mergers
 - ▶ Can not turn disk into bulge without any major mergers.
 - ▶ No disk galaxy massive enough to make the most massive ellipticals.
- ▶ Likely the mixed scenario is correct.
- ▶ **Moderate mass assembly in star-forming phase + Quenching + Moderate dry mergers.**

Faber et al (2007)

Hyper Suprime Cam (HSC)

- ▶ Imaging survey in 5 bands (grizy).
- ▶ 300 Subaru nights.
- ▶ 3-layer wedding cake:
 - ▶ Wide 2000 deg² to $i = 26$.
 - ▶ Deep 30 deg² to $i = 27$
 - ▶ Ultradeep 2 deg² to $i = 28$.
- ▶ Commissioning observing run very recently. Data looks good.

Robert Lupton

Prime Focus Spectrograph (PFS)

- ▶ New multi-object fiber-fed spectrograph on Subaru.
- ▶ 3 Channels, taking spectrum simultaneously from 3000\AA to $1.3\mu\text{m}$.
- ▶ 2400 spectra per exposure.
- ▶ No more “redshift desert”.
- ▶ Expected to start in 2018.

Sugai et al (2012)

Prime Focus Spectrograph (PFS)

Large Synoptic Survey Telescope (LSST)

- ▶ 8.4m custom-made telescope for wide-field imaging survey.
- ▶ The ultimate lensing+galaxy survey in foreseeable future.
- ▶ Expected to start by 2020.

Ivezic et al (2012)

Take-home Points

- ▶ **0th order:** Galaxy population at $z \sim 1$ is qualitatively the same as local population.
 - ▶ Two distinct groups (red & blue) already in place.
 - ▶ Red galaxies are round and has little star-formation.
 - ▶ Blue galaxies are disky and star-forming.
- ▶ **1st order:** Some evolution between then and now.
 - ▶ Star formation rate gradually decline.
(Star-formation main sequence).
 - ▶ Number of red galaxies increases.
- ▶ **Implications:** Combination of wet/dry mergers and star formation quenching turns blue galaxies into red galaxies.
- ▶ **Look forward to:** HSC, PFS and LSST
